                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This protein is one of two possible forms of a new cytokine produced by T lymphocytes induced by phorbol-2-myristate-3-acetate and phytohaemaglutinin. The proteins differ only in the amino acid at position 41 which is either Asp or Gly. The cytokine acts on monocytes and B lymphocytes and is useful in treatment of tumours and some infections and inflammatory conditions.

The b4 peptide is a preferred signal peptide to be fused to the N-terminus of the new cytckine. The last two amino acids (Ser-Pro) are opt. absent: when absent the signal peptide is designated b3. see Q28942.Q28947.
                                                                                                                                                                                                                          Caput D, Ferrara P, Guillemot J, Kaghad M, Labit-le Bouteiller C;

They are obtd. by site-directed mutagenesis of natural P600 sequences. The muteins antagonise the activity of IL-13 or IL-4. They have partial cytokine agonist activity, exhibit less than 80% maximal agonist activity of natural IL-2, and/or antagonize cytokine activity by least about 50% when present at a 100-fold excess. They and other cytokine muteins (see also R92790-94, R92796-802) are useful in the screening of cytokine and cytokine receptor levels, and in the diagnosis or treatment of e.g. inflammation, cancer, and degenerative disorders.
                                                                                              Cytokine; mutein; P600; interleukin-13; IL-13; agonist; antagonist; diagnosis; therapy; cancer; inflammation; degenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mutein(s) of human and murine cytokine(s), esp. interleukin(s) and murine P600 contg. amino acid substitutions. - useful for the diagnosis and treatment of cancer, inflammation, etc.

                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The polynucleotide sequences given in C69455 to C69502 encode the human secreted proteins given in B38203 to B38250. B38251 to B38320 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Example of activities include: immunosuppressive; antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; notropic; neuroprotective; antibacterial; virucide; funglide; and ophthalmological. The polynucleotides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological

                                                              The b2 peptide is a preferred signal peptide to be fused to the N-terminus of the new cytokine. The last two amino acids (Ser-Pro) are opt. absent; when absent the signal peptide is designated bl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human secreted protein sequence encoded by gene 38 SEQ ID NO:168.

                                                                                             anglogenesis, nervous system disorders, infections caused by bacteria, viruses and fungi and ocular disorders. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. C64446 to C69454 and B38202 represent sequences used in the exemplification of the
condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases, hyperproliferative disorders, cardiovascular disorders, cerebrovascular disorders,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 16, Sequence 8, At

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 6
E83551
conserved hypothetical protein PA0752 [imported] - Pseudomonas aeruginosa (strain PA01)
C; Species: Pseudomonas aeruginosa
C; Accession: E83551
R; Stover, C.K., Pham, X.Q.; Erwin, A.L.; Mizoguchi, S.D.; Warrener, P.; Hickey, M.J.; Bradman, S.; Yuan, Y.; Brody, L.L.; Coulter, S.N.; Folger, K.R.; Kas, A.; Larbig, K.; Lim,
C, Lory, S.; Olson, M.V.
Nature 406, 959-964, 2000
A; Title: Complete genome sequence of Pseudomonas aeruginosa PA01, an opportunistic pathch; Reference number: A82950; MUID:20437337
A; Reference number: A82950; MUID:20437337
A; Accession: E83551
A; Residues: Pre-Liminary
A; Molecule type: DNA
A; Residues: 1-505 <STO>
A; Cross-references: GB: AE004510; GB: AE004091; NID: 99946634; PIDN: AAG04141.1; GSPDB: GN001
A; Experimental source: strain PA01
C; Genetics:
A; Gene: PA0752

Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease

Claim 31; Page 234; 264pp; English,

```
Sequences Y58221-Y58222 and Y58223-Y58224 represent encoded and mature canine interleukin-13 (IL-13) clones 80 and 78. The invention relates to canine IL-4, canine or feline FIL-3 ligand, canine or feline CD40, canine or feline CD40, canine or feline CD40, canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nuclectides which encode these munuoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including aliengies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequences Y58221-Y58222 and Y58223-Y58224 represent encoded and mature

canine interleukin-13 (IL-13) clones 80 and 78. The invention relates to canine IL-4, canine or feline Flt-3 ligand, canine or feline CD40, canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (TRN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunorequilatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoinmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antique. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense aligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequences Y58221-Y58222 and Y58223-Y58224 represent encoded and mature canine interleukin-13 (IL-13) clones 80 and 78. The invention relates to canine IL-4, canine or feline Flt-3 ligand, canine or feline CD40,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophlactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primars and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for andiance of a contraction, and to acree of a contraction, and to acree of antibodies and to screen for an antisense oligonucleotides.

immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
colony-stimulating factor (GMCSF), and nucleotides which encode these
                                                                                                                                                                                                                                                                                                                                                                                Gaps

The proteins differ only in the amino acid at position 41 which is either Asp or Gly. The cytokine acts on monocytes and B lymphocytes and is useful in treatment of tumours and some infections and inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Caput D, Ferrara P, Guillemot J, Kaghad M, Labit-le Bouteiller C;

They are obtd. by site-directed mutagenesis of natural IL-13 sequences. The muteins antagonist activity of IL-13 or IL-4. They have partial cytokine agonist activity, exhibit less than 80% maximal agonist activity of natural IL-2, and/or antagonize cytokine activity by least about 50% when present at a 100-fold excess. They and other cytokine muteins (see also R92790-92, R92795-802) are useful in the screening of cytokine and cytokine receptor levels, and in the diagnosis or treatment of e.g. inflammation, cancer, and degenerative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mutein(s) of human and murine cytokine(s), esp. interleukin(s) and murine P600 contg. amino acid substitutions. - useful for the diagnosis and treatment of cancer, inflammation, etc.
